

MOTIVATION TO CHANGE!

Our screenings are designed to identify silent conditions that lead to stroke and cardiovascular disease. Our goal is to identify these conditions in the early stages so modifications and changes in our behaviors can be made in order to reduce risk and chronic conditions within the population.

There's no greater wake up call to patients than actually physically seeing the condition of their arteries. According to results from two related studies, patients who were shown images of their arteries, had the greatest compliance to their therapies. We perform ultrasound screenings in conjunction with biometric measurements, and various bloodwork panels to provide a comprehensive annual screening.

Normal Blood Flow

Abnormal Blood Flow
